

Introduction

CodiceFiscale is a .NET 9 library for working with Italian personal identifiers.

What it does

Feature	Class	Status
Validate a Codice Fiscale	<code>CodiceFiscaleValidator</code>	✓ Available
Parse a Codice Fiscale into personal data	<code>CodiceFiscaleParser</code>	✓ Available
Generate a Codice Fiscale from personal data	<code>CodiceFiscaleGenerator</code>	➡ Coming soon
Match a Codice Fiscale against personal data	<code>CodiceFiscaleMatcher</code>	➡ Coming soon
Validate an IBAN	<code>IBANValidator</code>	✓ Available
Validate an Italian VAT code (Partita IVA)	<code>ItalianVatCodeValidator</code>	✓ Available

Design principles

- **Local-only** — all logic runs in-process. No HTTP calls, no external services. Personal data never leaves your application.
- **Embedded datasets** — the municipality/Belfiore dataset (~7 800 comuni) and the foreign country codes (~260 countries) are compiled directly into the DLL as embedded resources. No files to deploy, no database to configure.
- **Lazy loading** — datasets are deserialized once on first use and cached for the lifetime of the process. Repeated calls are fast.
- **Immutable results** — all output types are C# `records` with `init`-only properties.

Supported platforms

- .NET 9.0+

Namespace CodiceFiscale

Classes

[CodiceFiscaleGenerator](#)

Provides methods to generate an Italian Codice Fiscale.

[CodiceFiscaleMatcher](#)

Provides methods to match and compare Italian Codice Fiscale strings.

[CodiceFiscaleParser](#)

Provides methods to parse an Italian Codice Fiscale into its constituent data.

[CodiceFiscaleValidator](#)

Provides methods to validate Italian Codice Fiscale codes.

[IBANValidator](#)

Provides methods to validate IBAN (International Bank Account Number) strings.

[ItalianVatCodeValidator](#)

Provides validation for Italian VAT codes (Partita IVA) and fiscal codes used in a VAT context.
